AMENDMENTS TO THE CLAIMS:

Please amend the claims as follows, substituting any amended claim(s) for the corresponding

pending claim(s):

1. (Currently Amended) For use in a fixed wireless access network comprising a plurality of

base stations capable of bidirectional time division duplex (TDD) communication with wireless

access devices disposed at a plurality of subscriber premises, a radio frequency (RF) modem shelf

comprising:

a first RF modem capable of communicating with a plurality of said wireless access devices

using TDD frames, each TDD frame having an uplink for receiving data and a downlink for

transmitting data; and

a modulation controller associated with said RF modem shelf capable of determining an

optimum modulation configuration for each of said plurality of wireless access devices

communicating with said first RF modem, wherein said modulation controller causes said first RF

modem to transmit downlink data to a first wireless access device in a first data block having within

a TDD frame using a first optimum modulation configuration and to transmit downlink data to a

second wireless access device in a second data block having within said TDD frame using a different

second optimum modulation configuration.

PATENT

2. (Currently Amended) The RF modem shelf as set forth in Claim 1 wherein said modulation

controller determines said first and second optimum modulation configurations based on channel

conditions associated with channels used to communicate with said first and second wireless access

devices.

3. (Original) The RF modem shelf as set forth in Claim 2 wherein said first modulation

configuration comprises a first modulation format and said second modulation configuration

comprises a different second modulation format.

4. (Original) The RF modem shelf as set forth in Claim 3 wherein said second modulation

format is more complex than said first modulation format if channel conditions associated with a

first channel used to communicate with said first wireless access device are noisier than channel

conditions associated with a second channel used to communicate with said second wireless access

device.

5. (Original) The RF modem shelf as set forth in Claim 4 wherein said first and second

modulation formats comprise one of binary phase shift keying (BPSK), quadrature phase shift keying

(QPSK), and 16 quadrature amplitude modulation (QAM).

6. (Currently Amended) The RF modern shelf as set forth in Claim 3 For use in a fixed wireless access network comprising a plurality of base stations capable of bidirectional time division duplex (TDD) communication with wireless access devices disposed at a plurality of subscriber premises, a radio frequency (RF) modern shelf comprising:

a first RF modem capable of communicating with a plurality of said wireless access devices using TDD frames, each TDD frame having an uplink for receiving data and a downlink for transmitting data; and

a modulation controller associated with said RF modem shelf capable of determining an modulation configuration for each of said plurality of wireless access devices communicating with said first RF modem, wherein said modulation controller causes said first RF modem to transmit downlink data to a first wireless access device in a first data block having a first modulation configuration and to transmit downlink data to a second wireless access device in a second data block having a different second modulation configuration,

wherein said modulation controller determines said first and second modulation configurations based on channel conditions associated with channels used to communicate with said first and second wireless access devices,

wherein said first modulation configuration comprises a first modulation format and said second modulation configuration comprises a different second modulation format, and

ATTORNEY DOCKET NO. WEST14-00026 U.S. SERIAL NO. 09/839,458

PATENT

wherein said first modulation configuration comprises a first forward error correction code

level and said second modulation configuration comprises a different second forward error correction

code level.

7. (Original) The RF modem shelf as set forth in Claim 6 wherein said first error correction

code level is more complex than said second error correction code level if channel conditions

associated with a first channel used to communicate with said first wireless access device are noisier

than channel conditions associated with a second channel used to communicate with said second

wireless access device.

8. (Original) The RF modem shelf as set forth in Claim 2 wherein said first modulation

configuration comprises a first physical beam forming technique and said second modulation

configuration comprises a different second physical beam forming technique.

9. (Currently Amended) A fixed wireless access network comprising:

a plurality of base stations capable of bidirectional time division duplex (TDD) communication with wireless access devices disposed at a plurality of subscriber premises; and

a radio frequency (RF) modem shelf comprising:

a first RF modem capable of communicating with a plurality of said wireless access devices using TDD frames, each TDD frame having an uplink for receiving data and a downlink for transmitting data; and

a modulation controller associated with said RF modem shelf capable of determining an optimum modulation configuration for each of said plurality of wireless access devices communicating with said first RF modem, wherein said modulation controller causes said first RF modem to transmit downlink data to a first wireless access device in a first data block having within a TDD frame using a first optimum modulation configuration and to transmit downlink data to a second wireless access device in a second data block having within said TDD frame using a different second optimum modulation configuration.

10. (Currently Amended) The fixed wireless access network as set forth in Claim 9 wherein said modulation controller determines said first and second optimum modulation configurations based on channel conditions associated with channels used to communicate with said first and second wireless access devices.

ATTORNEY DOCKET No. WEST14-00026 U.S. SERIAL No. 09/839,458

PATENT

11. (Original) The fixed wireless access network as set forth in Claim 10 wherein said first

modulation configuration comprises a first modulation format and said second modulation

configuration comprises a different second modulation format.

12. (Original) The fixed wireless access network as set forth in Claim 11 wherein said second

modulation format is more complex than said first modulation format if channel conditions

associated with a first channel used to communicate with said first wireless access device are noisier

than channel conditions associated with a second channel used to communicate with said second

wireless access device.

13. (Original) The fixed wireless access network as set forth in Claim 12 wherein said first and

second modulation formats comprise one of binary phase shift keying (BPSK), quadrature phase

shift keying (QPSK), and 16 quadrature amplitude modulation (QAM).

14. (Original) The fixed wireless access network as set forth in Claim 10 A fixed wireless access network comprising:

a plurality of base stations capable of bidirectional time division duplex (TDD) communication with wireless access devices disposed at a plurality of subscriber premises; and a radio frequency (RF) modem shelf comprising:

a first RF modem capable of communicating with a plurality of said wireless access devices using TDD frames, each TDD frame having an uplink for receiving data and a downlink for transmitting data; and

a modulation controller associated with said RF modem shelf capable of determining an modulation configuration for each of said plurality of wireless access devices communicating with said first RF modem, wherein said modulation controller causes said first RF modem to transmit downlink data to a first wireless access device in a first data block having a first modulation configuration and to transmit downlink data to a second wireless access device in a second data block having a different second modulation configuration,

wherein said modulation controller determines said first and second modulation configurations based on channel conditions associated with channels used to communicate with said first and second wireless access devices, and

ATTORNEY DOCKET NO. WEST14-00026 U.S. SERIAL NO. 09/839,458

PATENT

wherein said first modulation configuration comprises a first forward error correction code

level and said second modulation configuration comprises a different second forward error correction

code level.

15. (Original) The fixed wireless access network as set forth in Claim 14 wherein said first error

correction code level is more complex than said second error correction code level if channel

conditions associated with a first channel used to communicate with said first wireless access device

are noisier than channel conditions associated with a second channel used to communicate with said

second wireless access device.

16. (Original) The fixed wireless access network set forth in Claim 10 wherein said first

modulation configuration comprises a first physical beam forming technique and said second

modulation configuration comprises a different second physical beam forming technique.
